

Pairing Your Remote Control System For Systems Made Before January 2019

Most RFHero Remotes Control Systems manufactured prior to **January of 2019** will only have a learn/pairing button located **INSIDE** of the **Receiver**. If your **Receiver** has an external learn/pairing button, use the manual for pairing **Systems built in 2019**.

Internal Learn Button

1. Remove the lid on the **Receiver** by unscrewing the four (4) Philips head screws (one in each corner).
2. Make sure the **Transmitter** (Handheld) has batteries and appears to be functioning. Cycle power to the **Receiver**. You have 60 seconds to complete the Learn Mode procedure once step 2 is complete.
3. After the Communications LED flashes three (3) times, press and hold the Learn button in the **Receiver**.
4. Press and hold the Off button on the **Transmitter**.
5. Release the Off button on the **Transmitter** and the Learn button on the **Receiver**.
6. The Communications LED on the **Receiver** should now flash green/red (may appear orange) when a button on the **Transmitter** is pressed.
7. Replace the lid and screws on the **Receiver**.
8. The **Transmitter** and **Receiver** are now paired together.
